What is AI?

“Artificial Intelligence”: term coined by John McCarthy, widely recognized as the Father of AI.

“...the science and engineering of making intelligent machines.” – John McCarthy, 1950s

The Definitions of AI may be organized into four categories:

- > Systems that think like human
- > Systems that act like human
- > Systems that think rationally
- > Systems that act rationally

How it works?

Implemented by building algorithms based on a biologically-inspired programming paradigm. It uses software and programming languages to create neural networks.:

- > Neural networks consist of node layers, containing an input, hidden, and output layer.
- > Combining large amounts of data with algorithms allows the AI to learn automatically from patterns.

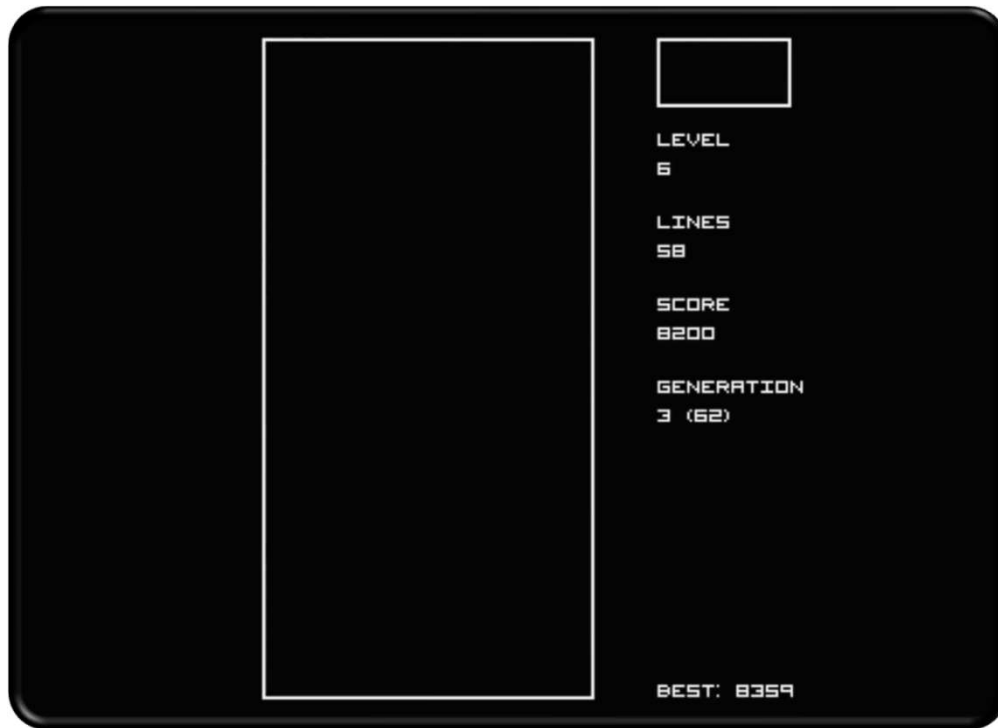

Applications

Health: Cancer Detection

Implementation

```
1 import pygame
2 import random
3
4 class TetrisAI:
5
6     def __init__(self, height, width):
7         self.height = height
8         self.width = width
9         for i in range(height):
10             new_line = []
11             for j in range(width):
12                 new_line.append(0)
13             self.field.append(new_line)
14
15     def intersects(self):
16         intersection = False
17         for i in range(4):
18             for j in range(4):
19                 if i*4+j in self.figure.image():
20                     if i+self.figure.y > self.height-1 or \
21                        j+self.figure.x > self.width-1 or \
22                        j+self.figure.x < 0 or \
23                        self.field[i+self.figure.y][j+self.figure.x] > 0:
24                         intersection = True
25
26     return intersection
```

Projects

Project “SMART”: AI Moonshot Challenge (1st edition winner)

Objective: forecasting and simulation of plastic accumulation in the ocean by combining Artificial Intelligence and Physics.

Promoted by:

Fundação para a Ciência e a Tecnologia

AGÊNCIA NACIONAL DE INOVAÇÃO

“Sophia” the Robot: Hanson Robotics

Objective: creating socially intelligent machines and platforms that simulate lifeforms that engage with people, for research, education, healthcare using a holistic architecture philosophy.

Final thoughts

“AI is the science and engineering of making intelligent machines.”

Software and biologically-inspired programming to create neural networks.

Versatile! Multiple applications: Healthcare, Lifestyle, Security, etc...

Self-Learning: improves its interpretation of data as time progresses .

A growing interest in this technology! More worldwide projects everyday!
